under

The banner features a light blue background with a black horizontal bar at the top and bottom. At the top, it says "In collaboration with" and "Supported By". Under "In collaboration with" are logos for SMARTBRIDGE, AICTE, and Smart Internz. Under "Supported By" are logos for Google Developers and Kotlin. The main text "Google Supported Virtual Internship Program" is in large green font, with "ANDROID BASICS IN KOTLIN" in smaller green font below it. On the right, there is a cartoon illustration of a person wearing headphones and working on a laptop at a desk, with a "zoom" logo at the bottom right.

Introduction to Android Development

Android operating system is the largest installed base among various mobile platforms across the globe. Hundreds of millions of mobile devices are powered by **Android** in more than 190 countries of the world. It conquered around **71%** of the global market share by the end of 2021, and this trend is growing bigger every other day. The company named **Open Handset Alliance** developed Android for the first time that is based on the modified version of the Linux kernel and other open-source software. **Google** sponsored the project at initial stages and in the year 2005, it acquired the whole company. In September 2008, the first Android-powered device was launched in the market. Android dominates the mobile OS industry because of the long list of features it provides. It's user-friendly, has huge community support, provides a greater extent of customization, and a large number of companies build Android-compatible smartphones. As a result, the market observes a sharp increase in the demand for developing Android mobile applications, and with that companies need smart developers with the right skill set. At first, the purpose of Android was thought of as a mobile operating system. However, with the advancement of code libraries and its popularity among developers of the divergent domain, Android becomes an absolute set of software for all devices like tablets, wearables, set-top boxes, smart

Features of Android

Android is a powerful open-source operating system that open-source provides immense features and some of

these are listed below:

- Android Open Source Project so we can customize the OS based on our requirements.
- Android supports different types of connectivity for GSM, CDMA, Wi-Fi, Bluetooth, etc. for telephonic conversation or data transfer.
- Using Wi-Fi technology we can pair with other devices while playing games or using other applications.
- It contains multiple APIs to support location-tracking services such as GPS.
- We can manage all data storage-related activities by using the file manager.
- It also supports different image formats like JPEG, PNG, GIF, BMP, MP3, etc.
- It supports multimedia hardware control to perform playback or recording using a camera and microphone.
- Android supports multi-tasking means we can run multiple applications at a time and can switch between them.

Android Versions:

These are the android version released until now

Code name	Version	API level
Oreo	8.1.0	API level 27
Oreo	8.0.0	API level 26
Nougat	7.1	API level 25
Nougat	7.0	API level 24
Marshmallow	6.0	API level 23
Lollipop	5.1	API level 22
Lollipop	5.0	API level 21
KitKat	4.4 - 4.4.4	API level 19
Jelly Bean	4.3.x	API level 18
Jelly Bean	4.2.x	API level 17
Jelly Bean	4.1.x	API level 16
Ice Cream Sandwich	4.0.3 - 4.0.4	API level 15, NDK 8
Ice Cream Sandwich	4.0.1 - 4.0.2	API level 14, NDK 7
Honeycomb	3.2.x	API level 13
Honeycomb	3.1	API level 12, NDK 6
Honeycomb	3.0	API level 11
Gingerbread	2.3.3 - 2.3.7	API level 10
Gingerbread	2.3 - 2.3.2	API level 9, NDK 5
Froyo	2.2.x	API level 8, NDK 4
Eclair	2.1	API level 7, NDK 3
Eclair	2.0.1	API level 6
Eclair	2.0	API level 5
Donut	1.6	API level 4, NDK 2
Cupcake	1.5	API level 3, NDK 1
(no code name)	1.1	API level 2
(no code name)	1.0	API level 1

Programming Languages used in Developing Android Applications :

1. Java

2. Kotlin

Developing the Android Application using Kotlin is preferred by Google, as Kotlin is made an official language for Android Development, which is developed and maintained by JetBrains. Previously before Java is considered the official language for Android Development. Kotlin is made official for Android Development in Google I/O 2017.

Advantages of Android Development

1. The Android is an open-source Operating system and hence possesses a vast community for support.
2. The design of the Android Application has guidelines from Google, which becomes easier for developers to produce more intuitive user applications

Disadvantages of Android Development

1. Fragmentation provides a very intuitive approach to user experience but it has some drawbacks, where the development team needs time to adjust to the various screen sizes of mobile smartphones that are now available in the market and invoke the particular features in the application.
2. The Android devices might vary broadly. So the testing of the application becomes more difficult.

Kotlin Android Basics

Kotlin is a statically typed, general-purpose programming language developed by JetBrains that has built world-class IDEs like IntelliJ IDEA, PhpStorm, Appcode, etc. It was first introduced by JetBrains in 2011 and a new language for the JVM. Kotlin is object-oriented language, and a “better language” than Java, but still be fully interoperable with Java code. Kotlin is sponsored by Google, announced as one of the official languages for **Android Development** in 2017.

Key Features of Kotlin

1. **Statically typed** – Statically typed is a programming language characteristic that means the type of every variable and expression is known at compile time. Although it is statically typed language, it does not require you to explicitly specify the type of every variable you declare.
2. **Interoperable with Java** – Kotlin runs on Java Virtual Machine (JVM) so it is totally interoperable with java. We can easily access use java code from kotlin and kotlin code from java.
3. **Smart Cast** – It explicitly typecasts the immutable values and inserts the value in its safe cast automatically.

Advantages of Kotlin Language

1. Easy to learn – Basic is almost similar to java. If anybody worked in java then easily understand in no time.
2. Kotlin is multi-platform – Kotlin is supported by all IDEs of java so you can write your program and execute them on any machine which supports JVM.
3. Kotlin programming language, including the compiler, libraries and all the tooling is completely free and

open source and available on GitHub.

Applications of Kotlin Language

- You can use Kotlin to build Android Application.
- Kotlin can also compile to JavaScript, and making it available for the frontend.
- It is also designed to work well for web development and server-side development
- Native App Development
- Cross-platform mobile app development
- Web Development

INDEX

CHAPTER 1: Introduction

1. Abstract
2. Objective
3. Problem Targeted
4. Problem's Primary Goals
5. Introduction

CHAPTER 2: Background & Diagrams

1. Background
2. Context Diagram

CHAPTER 3: Technical Requirements

1. Software
2. Hardware

CHAPTER 4: Implementation and Designing

1. MVVM
2. ROOM DATABASE
3. RECYCLERVIEW
4. COROUTINES
5. Step 1 to Step 8

CHAPTER 5: Conclusion and Future Scope

1. Expected Outcome
2. Conclusion & Future Scope

CHAPTER 6: URLs, Ids, Acknowledgements, Reflection Notes and References

1. URLs & Account Ids

3. Reflection Notes
4. References

CHAPTER 1: Introduction

1.1 ABSTRACT

Shopping is one of the activities that some people consider part of their life, while others do not even think of it. This comparison makes us discover people's problems with shopping. People have shopping problems such as limited time, expats in foreign countries without cars, a transportation issue, people consider physical shopping as a waste of time, health issues, longdistance to market and the difficulty in obtaining some items.

As the problems mentioned above, we have explored our idea, which is related to personal shopping. Therefore, we have built an application that combines different market shops, i.e. (Malls, supermarkets, and pharmacies).

This personal grocery shopping is an innovative app that allows the customers to get all their needs and suggest items based on previous history. Then deliver items to their doorstep and can facilitate online shopping procedure where customers can browse unlimited products all at one time. This work supports people in exploiting their time to be safer and more accessible than wasting it physically.

Moreover, people can order the product from home instead of going around for long distances for shopping. In addition, this app could help people who are facing health problems and unable to buy something physically to avoid future problems.

Finally, some people do not have transportation methods for shopping, and they should keep pace with the evolution.

1.2 OBJECTIVE

The main aim of this project is to list the items so that whenever users go to grocery stores, users will not be able to forget their items and this grocery application helps the users to tackle their day to day chaos more effortlessly.

1.3 Problem Targetted

It's not easy for the users to remember every item in this hectic lifestyle, they frequently can't recall their required necessity so we decided to build an app to store the items in the database for their future use. After buying the items users can delete the added items in the database.

1.4 PROBLEM'S PRIMARY GOALS

The goal of this project is to make an app that stores the user items in a cart and can modify and delete the added item in the list. To develop a reliable system, I have some specific goals such as:

- Develop a system such that users can add item details like product name, product Quantity, and Product Price
- Develop a database room that is used to store the user data which already been added by the user in the cart and the user can also remove the previously added item in the cart.
- Develop a good UI design that user friendly to the user.
- Develop a good UI that is supported for all android devices.

1.5 INTRODUCTION

Android is an open-source operating system that runs on the Linux kernel. With the advent of new mobile technologies, the mobile application industry is advancing rapidly. Consisting of several operating systems like Symbian OS, iOS, blackberry, etc., Android OS is recognized as the most widely used, popular and user-friendly mobile platform. This open-source Linux kernel based operating system offers high flexibility due to its customization properties making it a dominant mobile operating system.

Android is an open source and Linux-based Operating System for mobile devices such as smartphones and tablet computers. Android was developed by the Open Handset Alliance, led by Google, and other companies. Android offers a unified approach to application development for mobile devices which means developers need only develop for Android, and their applications should be able to run on different devices powered by Android. The first beta version of the Android Software Development Kit (SDK) was released by Google in 2007 where as the first commercial version, Android 1.0, was released in September 2008.

We are going to build a grocery application in android using Android Studio. Many times we forget to purchase

things that we want to buy, after all, we can't remember all the items, so with the help of this app, you can note down your grocery items that you are going to purchase, by doing this you can't forget any items that you want to purchase. In this project, we are using (MVVM) for architectural patterns, Room for database, RecyclerView and Coroutines to display the list of items.

CHAPTER 2: Background & Diagrams

2.1 BACKGROUND

The grocery cart application project will help the user or admin to store the list of items in proper sequence. User/Admin can add and remove the items in the list according to his/her will.

- UI DESIGN IN THE ANDROID PLATFORM
- ANDROID APPLICATION DEVELOPMENT
- DATABASE CONNECTION TO STORE USER DATA

2.2 CONTEXT DIAGRAM

CHAPTER 3: Technical Requirements

3.1 SOFTWARE

The Software Package is developed using Kotlin and Android Studio, basic SQL commands are used to store the database.

- Operating System: Windows 11
- Software: Kotlin and Java
- Emulator: Pixel 4 API 30

3.2 HARDWARE

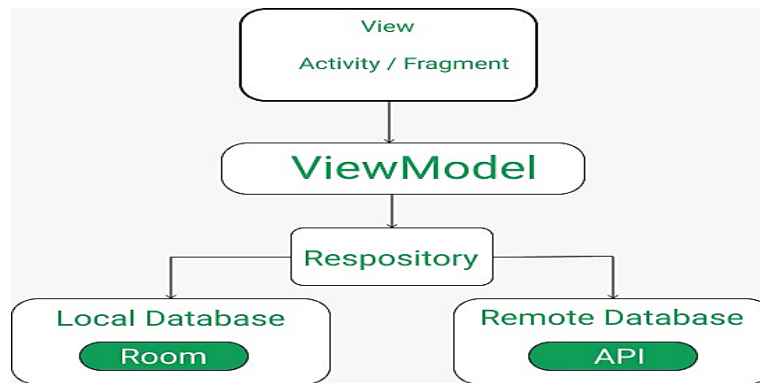

- RAM: 8 GB RAM
- ROM: 20 GB ROM

CHAPTER 4: Implementation and Designing

In this project, we are using **MVVM** (Model View ViewModel) for architectural patterns, **Room** for database, Coroutines and RecyclerView to display the list of items.

MVVM (Model View ViewModel)

MVVM architecture in android is used to give structure to the project's code and understand code easily. MVVM is an architectural design pattern in android. MVVM treat Activity classes and XML files as View. This design pattern completely separate UI from its logic. Here is an image to quickly understand MVVM.

ROOM Database

Room persistence library is a database management library and it is used to store the data of apps like grocery item name, grocery item quantity, and grocery item price. Room is a cover layer on **SQLite** which helps to perform the operation on the database easily.

RecyclerView

RecyclerView is a container and it is used to display the collection of data in a large amount of data set that can be scrolled very effectively by maintaining a limited number of views.

Coroutines

Coroutines are a lightweight thread, we use coroutines to perform an operation on other threads, by this our main thread doesn't block and our app doesn't crash.

Step By Step Process

Step 1: Create a New Project

To create a new project in Android Studio please refer to How to Create/Start a New Project in Android Studio. Note that select Kotlin as the programming language.

Step 2: Before going to the coding section first you have to do some pre-task

Before going to the coding part first add these libraries in your gradle file and also apply the plugin as 'kotlin-kapt'. To add these library go to **Gradle Scripts > build.gradle (Module: app)**.

Step 3: Implement Room Database

a. Entities class

The entities class contains all the columns in the database and it should be annotated with `@Entity` (tablename = "Name of table"). Entity class is a data class. And `@Column` info annotation is used to enter column variable name and datatype. We will also add Primary Key for auto-increment. Go to app > java >

com.example.application-name. Right-click on com.example.application-name go to new and create **Kotlin file/class** and name the file as **GroceryEntities**. See the code below to completely understand and implement.

b. DAO Interface

The DAO is an interface in which we create all the functions that we want to implement on the database. This interface also annotated with `@Dao`. Now we will create a function using suspend function which is a coroutines function. Here we create three functions, First is the insert function to insert items in the database and annotated with `@Insert`, Second is for deleting items from the database annotated with `@Delete` and Third

is for getting all items annotated with @Query. Go to the **app > java > com.example.application-name**. Rightclick on **com.example.application-name** go to new and create Kotlin file/class and name the file as **GroceryDao**. See the code below to implement.

C. Database class

Database class annotated with @Database(entities = [Name of Entity class.class], version = 1) these entities are the entities array list all the data entities associating with the database and version shows the current version of the database. This database class inherits from the Room Database class. In GroceryDatabase class we will make an abstract method to get an instance of DAO and further use this method from the DAO instance to interact with the database. Go to the **app > java > com.example.application-name**. Right-click on **com.example.application-name** go to new and create Kotlin file/class as **GroceryDatabase**.

Step 4: Now we will implement the Architectural Structure in the App

a. Repository class

The repository is one of the design structures. The repository class gives the data to the ViewModel class and then the ViewModel class uses that data for Views. The repository will choose the appropriate data locally or on the network. Here in our Grocery Repository class data fetch locally from the Room database. We will add constructor value by creating an instance of the database and stored in the db variable in the **Grocery Repository class**. Go to the **app > java > com.example.application-name**. Right-click on **com.example.application-name** go to new and create Kotlin file/class as **GroceryRepository**. Go to **app > java > com.example.application-name**. Right-click on **com.example.application-name** go to new and create a new Package called UI and then right-click on UI package and create a **Kotlin file/class**.

b. ViewModel class

ViewModel class used as an interface between View and Data. Grocery View Model class inherit from View Model class and we will pass constructor value by creating instance variable of Repository class and stored in repository variable. As we pass the constructor in View Model we have to create another class which is a Factory View Model class. Go to **app > java > com.example.application-name > UI**. Right-click on the UI package and create a Kotlin file/class and name the file as **GroceryViewModel**.

c. FactoryViewModel class

We will inherit the Grocery ViewModel Factory class from ViewModelProvider. NewInstanceFactory and again pass constructor value by creating instance variable of GroceryRepository and return GroceryViewModel (repository). Go to the **app > java > com.example.application-name > UI**. Right-click on the UI package and create a Kotlin file/class name it **GroceryViewModelFactory**.

Step 5: Now let's jump into the UI part

In the **activity_main.xml** file, we will add two ImageView, RecyclerView, and Button after clicking this button a **DialogBox** open and in that dialog box user can enter the item name, item quantity, and item price.

Step 6:

Let's implement RecyclerView. Now we will code the UI part of the row in the list. Go to **app > res > layout**. Right-click on layout, go to new, and then add a **Layout Resource File** and name it as **GroceryAdapter**. We will code adapter class for recycler view. In the GroceryAdapter class, we will add constructor value by storing entities class as a list in list variable and create an instance of the view model. In Grocery Adapter we will override three functions: **onCreateViewHolder**, **getItemCount**, and **onbindViewHolder**, we will also create an

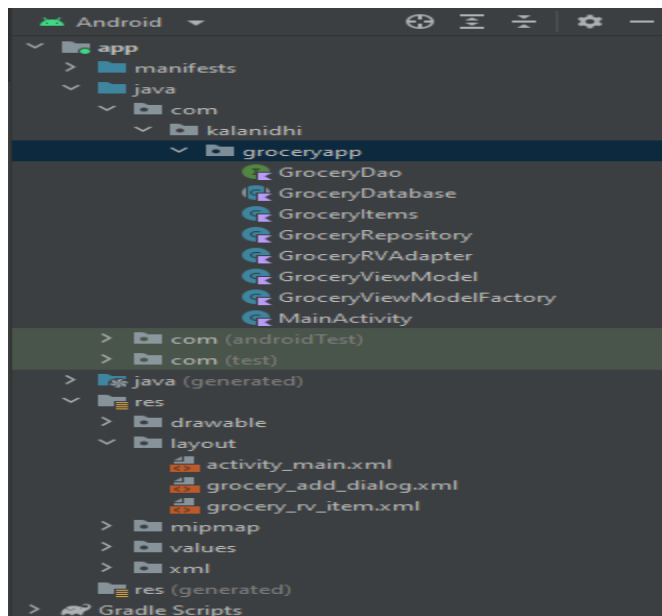

inner class called grocery view holder. Go to the **app > java > com.example.applicationname**. Right-click on **com.example.application-name** go to new and create a new Package called **Adapter** and then right-click on Adapter package and create a Kotlin file/class name it **GroceryAdapter**.

Step 7:

To enter grocery item, quantity, and price from the user we have to create an interface. To implement this interface we will use **DialogBox**. First create UI of dialog box. In this dialog box we will add three edit text and two text view. Three edit text to enter grocery item name, quantity and price. Two text view one for save and other for cancel. After clicking the save text all data saved into the database and by clicking on the cancel text dialog box closes. Go to the **app > res > layout**. Right-click on layout, go to new and then add a Layout Resource File and name it as **GroceryDialog**. To add a clicklistener on save text we have to create an interface first in which we create a function. Go to the **app > java > com.example.applicationname > UI**. Right-click on the **UI package** and create a Kotlin file/class and create an interface name it as **DialogListener**.

STEP 8:

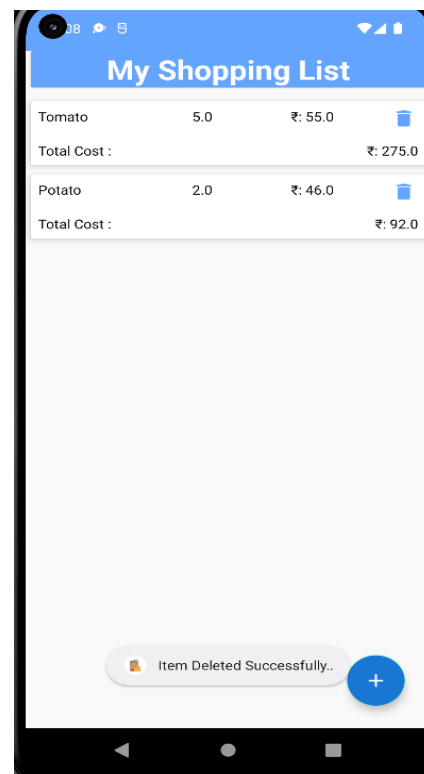

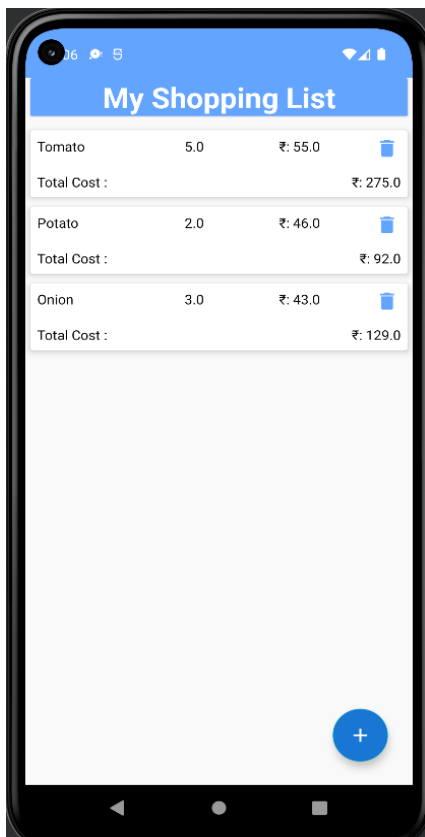

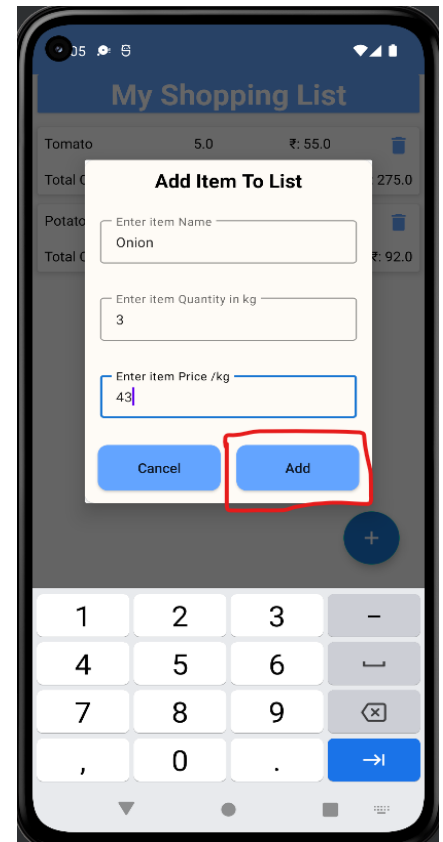

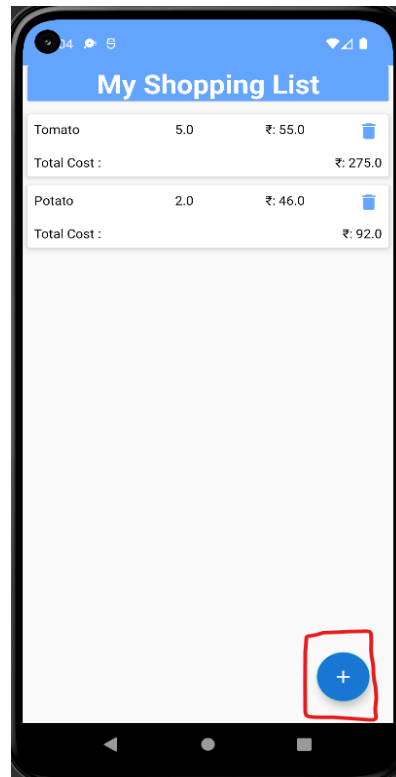

In this final step we will code in our **MainActivity**. In our MainActivity, we have to set up the recycler view and add click listener on add button to open the dialog box.

Complete Project Structure

CHAPTER 5: Conclusion and Future Scope

5.1 Expected Outcome

5.2 Conclusion & Future Scope

This grocery application will help to store the list of data items include name of item, price and quantity required. Admins store his/her data in the list, the grocery application very helpful to users.

Future Scope:

This application helps to store the list of items by Admin. In Future we can also add scheduled addition of items according to requirement of user.

The Features are:

- Add User Panel
- Add Admin Panel
- Provide Login Authentication
- Add Image to user Product and Rating

CHAPTER 6: URLs, Ids, Acknowledgements, Reflection Notes and References

6.2 Acknowledgements

I have taken much efforts in this project. However, it would not have been possible without the kind support and help of many individuals and organizations. I would like to extend my sincere thanks to all of them.

I am highly indebted to SMARTINTERNZ (Experiential Learning & Remote Externship Platform to bring academia & industry very close for a common goal of talent creation) for their guidance and constant supervision as well as for providing necessary information regarding the project & also for their support in completing the project. I would like to express my gratitude towards member of (Smart Internz) for their kind co-operation and encouragement which help me in completion of this project.

I would like to express my special gratitude and thanks to industry persons for giving me such attention and time.

My thanks and appreciations also go to people who have willingly helped me out with their abilities.

6.3 Reflection Notes

I thoroughly enjoyed my internship and had a very valuable experience under my belt. I know this will help when looking for jobs and needing references.

I know that practical experience is the best, and internships give students that hands-on experience they need. I feel that quality internships are essential to develop key skills that we can't get in a classroom. Skills such as multitasking, communicating, learning to deal with diversity, and dealing with deadlines are different when you are working for someone else, not yourself like everyone do it college. Internships are also a great way to network with people in the industry. Our mentor and co-workers were great about giving us contacts and referring us to open positions in the industry

I have learned that stressing over little things will not get us anywhere. I have learned to work well as a team

and that without my counter parts the work would not get done. Another aspect that I learned throughout the internship is to never be afraid to ask lots of questions. By asking questions we get answers.
